Not illustrated. 1916 Excerpt: . pound of steam, or for every 160 square feet of radiation 40 pounds of steam. Since a small engine of average economy requires about 40 pounds of steam to produce a K. W., it is obvious that the steam necessary to maintain 160 square feet of radiation will, on its way to that radiation, if passed through a small engine, produce a K. W. of electric energy as a by-product. Dr. Carpenter and Professor Breckenridge in their criticisms, given in the introduction to this report, state that one square foot of radiation will maintain a desired temperature on the average in: 60 to 100 cubic feet of building contents (Dr. Carpenter). 80 to 140 cubic feet of building contents (Professor Breckenridge). A fair average between those assumptions, minimum (60 cubic feet), and maximum (140 cubic feet), would be 100 cubic feet of building contents to every square foot of radiation.
