

Calculus, with Applications; An Introduction to the Mathematical Treatment of Science (Paperback)

Filesize: 9.73 MB

Reviews

Undoubtedly, this is the greatest job by any author. It is actually filled with wisdom and knowledge I am quickly could get a pleasure of reading a written book.
(Kade Ankunding)

Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1900 Excerpt: . distance; what will be its velocity on reaching the surface of the earth, all forces besides the earth's attraction being disregarded? We have $\sqrt{2}$ (32.155) (3960) (5280) .., $v =$ miles per second, 5280 $F = 7$ miles per second, approximately. By great heights we may mean such various heights as those attained by the kites flown at the Blue Hill Observatory (8000 ft.), or by AndreVs balloon; or the height of a meteorite when it first becomes visible. In the practical consideration of the velocities of bodies falling from such heights, the resistance of the air must be taken into account. For a discussion of the vertical motion of a body in a resisting medium, see Greenhill's Calculus, Art. 76. 64. Let a body free to move be subjected to an attractive force that varies directly as the distance of the body from the point where the force is located. If we take this point as origin, with a line passing through the body for the x -axis, we have $\frac{d^2x}{dt^2} = -Mx$. The coefficient M is seen to be the value of the acceleration when $x=1$; that is, when the body is at a unit's distance from the origin. The minus sign is used for the same reason that was given in Art. 63. Multiplying by dx and integrating, $2dx \frac{dx}{dt} = -2Mx dx$ when $x = a$, $C = -Mx^2$; $\frac{dx}{dt} = \sqrt{a^2 - x^2}$. Writing this equation so...
